ProM
The process mining framework
Version 4.1

How to install ProM

• Drag the ProM application to your Application folder.

• We use DOT to do the graph layout in ProM. Therefore, to see graphs in ProM, you need to install the Graphviz package for Mac OS X.

There are two ways to do this:

a) The easiest way is to download the Graphviz package for Mac OS X from this website:
   http://www.pixelglow.com/graphviz/download/
   (direct link: Graphviz dmg (1.4M)).

Mount the Graphviz disk image, and drag the contained Graphviz application to your Application folder.

All set! Start ProM by clicking on its icon in the Application folder.

b) For the best performance, you may want to download the unofficial, but - in contrast to the original page - actively maintained Graphviz builds from the following website:

http://www.ryandesign.com/graphviz/

(direct link: Intel (8.2MiB), PowerPC (8.5MiB)).

Mount the Graphviz disk image, and use the installer to install the contained Graphviz application.

Use the Terminal to find out the location of your dot executable (e.g., `/usr/local/graphviz-2.12/bin/dot`). Start ProM by clicking on its icon in the Application folder. Choose `Help -> Set custom dot executable ...` from the menu and provide the location of your executable. Click the button `set dot location`. All set!
